I. Questions

Question 1: Emoji Expressions Imagine you're analyzing social media posts for sentiment analysis. If you were to create a variable named "postSentiment" to store the sentiment of a post using emojis (for positive, for neutral, for negative), what data type would you assign to this variable? Why? (*narrative type question, no code required*)

Solution: I would assign the character data type to this variable as it is a categoric variable that is ordinal in nature.

Question 2: Hashtag Havoc In a study on trending hashtags, you want to store the list of hashtags associated with a post. What data type would you choose for the variable "postHashtags"? How might this data type help you analyze and categorize the hashtags later? (*narrative type question, no code required*)

Solution: I would choose the character (string) data type for the variable. This data type allows every hashtag to be recognised as a unique entity, repetitions of which can later then be recorded and recognised.

Question 3: Time Traveler's Log You're examining the timing of user interactions on a website. Would you use a numeric or non-numeric data type to represent the timestamp of each interaction? Explain your choice (*narrative type question, no code required*)

Solution: I would use the non-numeric data type to represent the timestamp as every timestamp is unique and, unlike numeric variables like height and population, cannot be processed or manipulated to determine numeric qualities like mean and median.

Question 4: Event Elegance You're managing an event database that includes the date and time of each session. What data type(s) would you use to represent the session date and time? (*narrative type question, no code required*)

Solution: I would use the character (string) data type to represent the session date and time.

Question 5: Nominee Nominations You're analyzing nominations for an online award. Each participant can nominate multiple candidates. What data type would be suitable for storing the list of nominated candidates for each participant? (*narrative type question, no code required*)

Solution: The character (string) data type would be suitable for storing the list of nominated candidates.

Question 6: Communication Channels In a survey about preferred communication channels, respondents choose from options like "email," "phone," or "social media." What data type would you assign to the variable "preferredChannel"? (*narrative type question, no code required*)

Solution: I would assign the character (string) data type to the variable.

Question 7: Colorful Commentary In a design feedback survey, participants are asked to describe their feelings about a website using color names (e.g., "warm red," "cool blue"). What data type would you choose for the variable "feedbackColor"? (*narrative type question, no code required*)

Solution: I would choose the character (string) data type for the variable.

Question 8: Variable Exploration Imagine you're conducting a study on social media usage. Identify three variables related to this study, and specify their data types in R. Classify each variable as either numeric or non-numeric.

Solution: The three variables could be the social media platforms used [character (string), non-numeric], the number of hours spent on social media in total [numeric (double), numeric] and the reasons for social media usage [character (string), non-numeric].

Question 9: Vector Variety Create a numeric vector named "ages" containing the ages of five people: 25, 30, 22, 28, and 33. Print the vector.

Solution:

```
# Enter code here
ages <- c(25,30,22,28,33)
print(ages)
```

```
## [1] 25 30 22 28 33
```

Question 10: List Logic Construct a list named "student_info" that contains the following elements:

- A character vector of student names: "Alice," "Bob," "Catherine"
- A numeric vector of their respective scores: 85, 92, 78
- A logical vector indicating if they passed the exam: TRUE, TRUE, FALSE

Print the list.

Solution:

```
# Enter code here
student_info = list(student=c("Alice","Bob","Catherine"),score=c(85,92,78),pass=c(TRUE,TRUE,FALSE))
print(student_info)
```

```
## $student
## [1] "Alice"     "Bob"       "Catherine"
##
## $score
## [1] 85 92 78
##
## $pass
## [1]  TRUE  TRUE FALSE
```

Question 11: Type Tracking You have a vector "data" containing the values 10, 15.5, "20", and TRUE. Determine the data types of each element using the typeof() function.

Solution:

```r
# Enter code here
data <- c(10,15.5,"20",TRUE)
typeof(data[1])
```

```
## [1] "character"
```

```r
typeof(data[2])
```

```
## [1] "character"
```

```r
typeof(data[3])
```

```
## [1] "character"
```

```r
typeof(data[4])
```

```
## [1] "character"
```

Question 12: Coercion Chronicles You have a numeric vector "prices" with values 20.5, 15, and "25". Use explicit coercion to convert the last element to a numeric data type. Print the updated vector.

Solution:

```r
# Enter code here
prices <- c(20.5,15,"25")
prices <- as.numeric(prices)
print(prices)
```

```
## [1] 20.5 15.0 25.0
```

Question 13: Implicit Intuition Combine the numeric vector c(5, 10, 15) with the character vector c("apple", "banana", "cherry"). What happens to the data types of the combined vector? Explain the concept of implicit coercion.

Solution:

```r
# Enter code here
x <- c(5L,10L,15L)
typeof(x)
```

```
## [1] "integer"
```

```r
x <- c(x,"apple","banana","cherry")
typeof(x)
```

```
## [1] "character"
```

The data type of the combined vector changes from integer to character. Implicit coercion refers to the automatic type conversion by R based on the contents of the vector.

Question 14: Coercion Challenges You have a vector "numbers" with values 7, 12.5, and "15.7". Calculate the sum of these numbers. Will R automatically handle the data type conversion? If not, how would you handle it?

Solution:

```
# Enter code here
numbers <- c(7,12.5,"15.7")
sum(numbers)
```

R will not automatically handle the data type conversion.

```
# Enter code here
numbers <- c(7,12.5,"15.7")
numbers <- as.numeric(numbers)
sum(numbers)
```

```
## [1] 35.2
```

Instead, explicit coercion has to be employed to convert the data type of the vector to numeric (double) before the sum of the numbers can be calculated.

Question 15: Coercion Consequences Suppose you want to calculate the average of a vector "grades" with values 85, 90.5, and "75.2". If you directly calculate the mean using the mean() function, what result do you expect? How might you ensure accurate calculation?

Solution:

```
# Enter code here
grades <- c(85,90.5,"75.2")
mean(grades)
```

As demonstrated above, if the mean is directly calculated using the mean() function, an "NA" result is obtained as the vector is not entirely numeric.

```
# Enter code here
grades <- c(85,90.5,"75.2")
grades <- as.numeric(grades)
mean(grades)
```

```
## [1] 83.56667
```

Thus, explicit coercion has to be employed first to convert the vector to the numeric (double) data type before calculation.

Question 16: Data Diversity in Lists Create a list named "mixed_data" with the following components:

- A numeric vector: 10, 20, 30
- A character vector: "red", "green", "blue"

- A logical vector: TRUE, FALSE, TRUE

Calculate the mean of the numeric vector within the list.

Solution:

```
# Enter code here
mixed_data = list(numeric_vector=c(10,20,30),character_vector=c("red","green","blue"),logical_vector=c(
mean(mixed_data$numeric_vector)
```

```
## [1] 20
```

Question 17: List Logic Follow-up Using the "student_info" list from Question 10, extract and print the score of the student named "Bob."

Solution:

```
# Enter code here
student_info = list(student=c("Alice","Bob","Catherine"),score=c(85,92,78),pass=c(TRUE,TRUE,FALSE))
student_info$student
```

```
## [1] "Alice"     "Bob"       "Catherine"
```

```
print(student_info$score[2])
```

```
## [1] 92
```

Question 18: Dynamic Access Create a numeric vector values with random values. Write R code to dynamically access and print the last element of the vector, regardless of its length.

Solution:

```
# Enter code here
numeric_vector <- c(1,2,3,4,5,6,7,8,9,10)
print(numeric_vector[length(numeric_vector)])
```

```
## [1] 10
```

Question 19: Multiple Matches You have a character vector words <- c("apple", "banana", "cherry", "apple"). Write R code to find and print the indices of all occurrences of the word "apple."

Solution:

```
# Enter code here
words <- c("apple","banana","cherry","apple")
output <- 1:length(words)
print(output[words=="apple"])
```

```
## [1] 1 4
```

Question 20: Conditional Capture Assume you have a vector ages containing the ages of individuals. Write R code to extract and print the ages of individuals who are older than 30.

Solution:

```
# Enter code here
ages <- c(53,54,65,82,21,15,81,16,7,3)
ages[ages>30]
```

```
## [1] 53 54 65 82 81
```

Question 21: Extract Every Nth Given a numeric vector sequence <- 1:20, write R code to extract and print every third element of the vector.

Solution:

```
# Enter code here
sequence <- 1:20
sequence[seq(from=3,to=20,by=3)]
```

```
## [1]  3  6  9 12 15 18
```

Question 22: Range Retrieval Create a numeric vector numbers with values from 1 to 10. Write R code to extract and print the values between the fourth and eighth elements.

Solution:

```
# Enter code here
numbers <- 1:10
print(numbers[4:8])
```

```
## [1] 4 5 6 7 8
```

Question 23: Missing Matters Suppose you have a numeric vector data <- c(10, NA, 15, 20). Write R code to check if the second element of the vector is missing (NA).

Solution:

```
# Enter code here
data <- c(10,NA,15,20)
print(is.na(data[2]))
```

```
## [1] TRUE
```

Question 24: Temperature Extremes Assume you have a numeric vector temperatures with daily temperatures. Create a logical vector hot_days that flags days with temperatures above 90 degrees Fahrenheit. Print the total number of hot days.

Solution:

```r
# Enter code here
temperatures <- c(85,98,76,82,96,100)
hot_days <- temperatures>90
print(sum(hot_days))
```

```
## [1] 3
```

Question 25: String Selection Given a character vector fruits containing fruit names, create a logical vector long_names that identifies fruits with names longer than 6 characters. Print the long fruit names.

Solution:

```r
# Enter code here
fruits <- c("apple","blueberry","durian","mangosteen")
long_names <- nchar(fruits)>6
print(fruits[long_names])
```

```
## [1] "blueberry"  "mangosteen"
```

Question 26: Data Divisibility Given a numeric vector numbers, create a logical vector divisible_by_5 to indicate numbers that are divisible by 5. Print the numbers that satisfy this condition.

Solution:

```r
# Enter code here
numbers <- 1:30
divisible_by_5 <- numbers%%5==0
print(numbers[divisible_by_5])
```

```
## [1]  5 10 15 20 25 30
```

Question 27: Bigger or Smaller? You have two numeric vectors vector1 and vector2. Create a logical vector comparison to indicate whether each element in vector1 is greater than the corresponding element in vector2. Print the comparison results.

Solution:

```r
# Enter code here
vector1 <- 1:10
vector2 <- 10:1
comparison <- vector1>vector2
print(comparison)
```

```
##  [1] FALSE FALSE FALSE FALSE FALSE  TRUE  TRUE  TRUE  TRUE  TRUE
```
